

SEMESTER 2

DIPLOMA 2025/2026

FACULTY:

INFORMATION AND COMMUNICATION TECHNOLOGY

SUBJECT:

SYSTEM DEVELOPMENT WORKSHOP

(DITU 3934)

TITLE:

PROPOSAL WORKSHOP PROJECT: PEER LEARNING COMMUNITY (SCHOLARSPACE)

LECTURER:

TS. NOR HASLINDA BINTI ISMAIL

PREPARED BY:

INTRODUCTION

Universities are high-level educational institutions where students pursue degrees and academic research is conducted. In today's environment, students can both access and generate a vast amount of knowledge, thanks in large part to technological advancements over the past century.

From lecture notes and study tips to creative ideas, the amount of knowledge grows rapidly with each generation. However, this information is often scattered across multiple platforms and individuals, making collaboration and knowledge sharing inefficient due to cascade effects where valuable insights may fail to propagate effectively if blocked within isolated groups.

This pre-proposal presents **ScholarSpace**, a secure, student-centred online community designed to foster supplemental instruction and academic collaboration. The platform provides a single space for students and graduates of all majors to post notes, share ideas, engage in discussions, and offer study tips and methods especially insights drawn from senior or graduate experiences. ScholarSpace aims to enhance learning, encourage collaboration, and strengthen the sense of community on campus while also eliminating the cascade effect as much as possible.

PROBLEM STATEMENT

Currently, the way students communicate, share notes and ideas are either through face-to-face communication or social media that are built not around a proper learning environment. Most of the social media that are available now in the market right now mostly focuses on worldwide and generality of the subject and courses in general. This causes the inefficiency of learning due to the mismatch of the syllabus and without this so-called social media “Cascade effect” are prone to happen.

OBJECTIVES

ScholarSpace aims to:

- To develop a centralized platform for students to share academic resources and enable structured discussions among students within the same academic field.
- To improve knowledge sharing by reducing information fragmentation and encourage collaboration.
- To provide an insight of the working field from the graduates to their juniors.

PROJECT SCOPE

This project focuses on the development of ScholarSpace, a web-based platform designed for university students and graduates to share academic resources and engage in discussions within their respective field of study and works. The system will support structured content sharing and community interaction in a centralized environment.

The scope of the project includes:

- User registration and login system for students and graduates
- Creation and management of private groups for collaborative discussions and assignment work
- Posting and sharing of notes, study tips, academic ideas, and insights into real-world applications.
- Content organization using categories such as course, faculty, topic, and type of material
- File sharing functionality, allowing users to upload, download, and manage academic resources (e.g., documents, notes, assignments)
- Ability to publish refined group discussions or outputs to the public platform for wider access
- Basic search functionality to relevant post and materials.
- Ability for users to upvote and downvote.
- Thread activity indicators to reflect engagement levels (e.g., active, inactive)

Target Users:

The system is designed for individuals within the university community, including students and graduates. Each user type has specific roles and access to different system functions.

Students:

- Register and log in to the platform
- Post and share notes, idea, study tips
- Participate in discussions threads.
- Search and browse academic content by subject or category.
- Interact with posts.
- Create a group for private discussion
- Share the improved note to the forum for public access.

Graduates:

- Share advanced study methods and personal academic experiences
- Provide advice on courses, projects, and career preparation.
- Participate in discussions and answer questions.
- Upload higher-level or refined academic resources.

Administrator:

- Manage user accounts (approve, suspend, or remove users).
- Monitor and moderate content.
- Remove inappropriate or irrelevant posts.
- Manage categories and system settings

PROJECT SIGNIFICANCE

The proposed ScholarSpace platform offers several key benefits to its users. Firstly, it provides a centralized and structured environment for accessing and sharing academic resources, which reduces information fragmentation and improves the efficiency of knowledge acquisition. Secondly, it enhances collaborative learning by enabling meaningful, field-specific discussions among students and graduates, fostering peer-supported education and stronger academic engagement. Lastly, the platform delivers valuable real-world insights through contributions from graduates, allowing students to gain practical guidance on academic progression and career preparation, thereby bridging the gap between academic study and professional application.

TEAM MEMBERS & WORK BREAKDOWN STRUCTURE

1. MUHAMMAD AFIF NAUFAL BIN MOHD.ZAIDI (Project lead) – Making the bases and the project roadmap, wireframe and product specification for the project.
2. ASHLEE SIA WEI TIEN (Frontend developer) – Designing the bases of the UI and collaborating with other team members to make sure the idea can be utilized.
3. NURIN SOFIA BINTI SATTBUDIN (UI/UX designer) – Working closely with the designer to make sure the user won't get confused when using the web and keeping things clear and easy to use
4. YEOH JIA POH (Backend developer) – Building the logic and the system like user authentication login and making sure it's reliable while able to use designer's idea.
5. MUHAMMAD IQBAL HAZIQ BIN NAZIF (QA Tester) – Testing the features and finding bugs within the core system while providing constructive feedback to make sure the end product is ready and work almost flawlessly.
6. DIVISHA A/P PARAMU (Database designer) – Making a database design that can take the upcoming flow of content by the user and designing the database and helping the backend with logic of the system.

MILESTONES: DELIVERABLES & IMPORTANT DATES

Week 1

- **Student Task:** Students attend the project briefing, form teams and brainstorm ideas.

Week 2 - 4

- **Student Task:** Students propose a project title and get approval by submitting a preproposal, pitching and updating the proposal and finally submitting it.

Week 5 - 7

- **Student Task:** Students work on the conceptual design (Project Part 1) and complete the analysis phase, including requirement and functional analysis, as well as DFD and ERD with a minimum of five tables.

Week 8 - 12

- **Student Task:** Students carry out the implementation phase, including front-end, back-end and database development.

Week 13

- **Student Task:** Students perform testing, including functional testing, system testing and user acceptance testing.

Week 14

- **Student Task:** Students prepare slides and the final report for the project presentation.

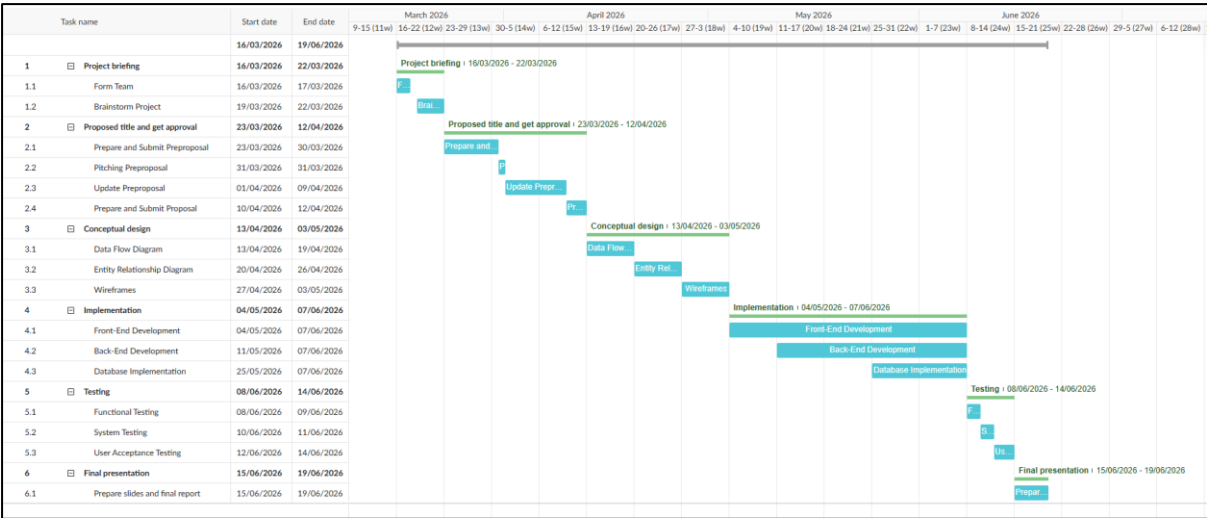

Figure: Project Schedule and Gantt Chart, 14-week Schedule from initial project briefing to final presentation

CONCLUSION

In conclusion, the proposed system aims to provide a centralized platform for students to share, discuss, and organize information efficiently, similar to a Reddit-style environment for their familiarity and convenience. By integrating core features such as user authentication, post creation, commenting, and upvoting mechanisms, the system encourages active participation and structured knowledge exchange.

The development plan outlined ensures a clear workflow, proper task distribution, and achievable milestones, making the implementation both practical and scalable. With a strong focus on usability and collaboration, this platform has the potential to improve how users interact and share insights within a digital community.
